# This is TopLogic

Create Apps automatically
with TopLogic - the automated app engine

Do you want to digitize your processes to make your business more productive? Be agile. Describe the processes to be digitized and let TopLogic automatically generate the app. Only a matter of a few weeks without the detour imposed by formulating comprehensive specifications and with results that correspond exactly to what your users need.
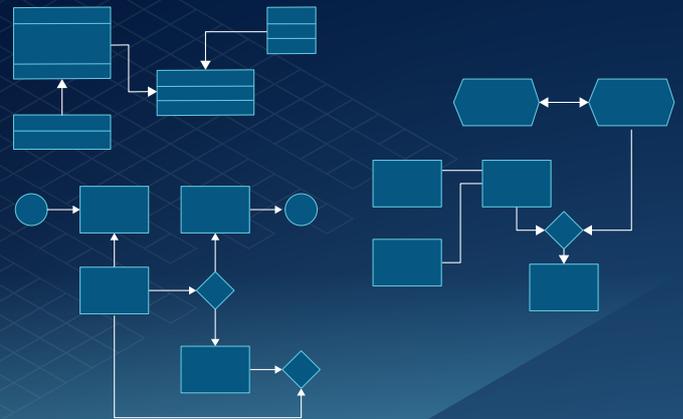

From Model to Application
and from the Application to the Model

TopLogic - the automated app engine is the NoCode platform that allows you to create applications for any process or use case quickly and without programming effort. You do not need software developers, just professionals who are able to describe business and process requirements in models. TopLogic automatically converts the models into apps running on the same platform. You can change and extend them at run time. This always automatically provides a complete application model, no more discrepancy between requirements and implementation, and if NoCode is not enough to meet the requirements, use the LowCode features or the full programming environment of the TopLogic Studio.

Creation Process

When creating an app, it doesn't matter if you describe the application model with data, processes, functions, and permissions in TopLogic or in the tools you're already using. TopLogic processes external models into an app just as easily and automatically.

Complex Process Landscapes

TopLogic digitizes complex process landscapes. Create and operate multiple apps in parallel with TopLogic. These apps do not need interfaces to exchange data and models, but share them via a common bus system. Despite the decentralized application architecture, this creates a single source of truth and enables consistent reuse. The apps created with TopLogic fit perfectly into your existing IT and process landscape, since TopLogic representations are used for these applications so that communication can be done at the same model level in a heterogeneous application environment.

ENTERPRISE SERVICE BUS
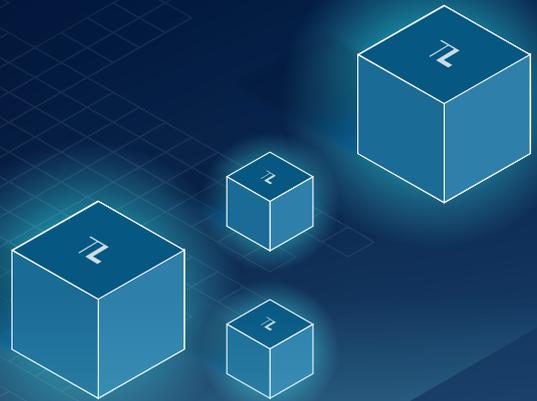

Close digitization gaps
with TopLogic

TopLogic is particularly well suited to closing digitization gaps in existing process landscapes – TopLogic does it quickly, is cost effective and is easy on resources.

Put TopLogic to the test

Want to test TopLogic? Create a proof of concept together with us or one of our partners or learn more about the possibilities of NoCode development in our workshops.
